Crolles July 16th 2012

To: whom it may concern

Tree care techniques are not always covered by EN standards. Globally , Tree care techniques do not use a back up solution (back up rope + device) while evolving in a tree with the "prussic & pulley" techniques. Note also that EN 12841 standard for its part has been created for rope access in "industrial environments".

Petzl RIG and Petzl ID have been designed and tested to abseil on one single rope as described in their technical notice. The known to date hazards in use of the Petzl RIG and Petzl ID are described in the technical notice and in the Product Experience available on www.petzl.com .

Petzl RIG and Petzl ID can be used for abseiling with or without a back up solution , as long as the user take in consideration in his own risk analysis these known hazards of the Petzl RIG and the Petzl ID , plus all the other hazards in relation with abseiling and all the other hazards of his specific uses.

Sincerely

B.Bressoux
